# Engineering plastics for the E&E industry

Products, applications, typical values

# Engineering plastics for the E&E industry

---

Plastics used in electrical applications have to show excellent electrical performance, good mechanical properties as well as high dimensional stability under heat. In daily operation, they have to guarantee insulation and therefore secure handling. They have to reduce fire risk in the event of an electrical defect or exposure to external sources of ignition.

With a lot of applications, the plastic is used for designing the exterior of components as well. This is why design requirements, e.g. for surface quality, haptics, and colors, are becoming more and more important.

RANGE CHART – TYPICAL VALUES	18-47

# Ultramid® (PA)

Ultramid® (PA: polyamide) has good electrical insulation properties, useful sliding friction performance, and excellent mechanical strength. It is available in a wide range of flame-retardant grades, and is therefore used in almost every sector of industrial control units, connection technology, electronics as well as in household appliances.

The fundamental chemical structure of polyamides makes them highly suitable for use with halogen-free flame retardants. Ultramid® compounds mainly use halogen-free flame retardants, giving extremely low smoke density and smoke toxicity in the event of a fire (Fig. 1). This is becoming more and more important, e.g. in material specifications for rail vehicles, aircraft, and public buildings. The flame-retardant Ultramid® grades are particularly successful in complying with these more stringent requirements. Values for tracking resistance also compare favorably with those of halogen-containing flame retardant systems (Fig. 2).

Control unit for dual-clutch transmission

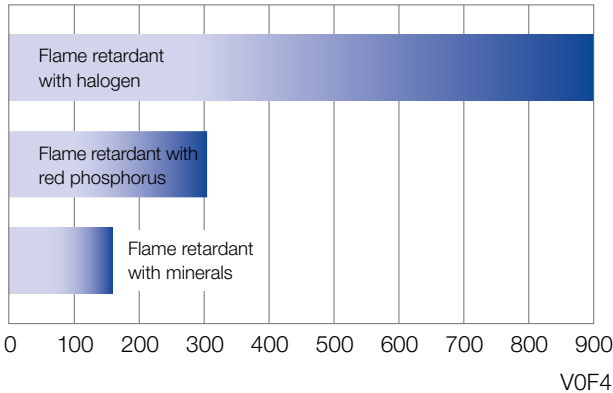

Fig. 1: NF X 10-702 smoke density after four minutes

Fig. 2: IEC 112 tracking resistance of flame-retardant polyamides

The Ultramid® grades A3X2G5, A3X2G7, A3X2G10, A3XZG5, and Ultramid® T KR 4365 G5 combine excellent mechanical and tribological properties with high tracking resistance and good fire performance. They meet the requirements of UL94 V-0 and 5VA and display the best flame-retardant additive stability in their material class. The comparative tracking index (CTI) according to IEC 60112 can reach up to 600. In control units, for example, this guarantees a constantly high level of security as far as the electrical functions are concerned. These products can also be processed easily and cost-effectively.

They are a preferred material for many electrical engineering applications and most often used in industrial switchgear and automation. The A3X grades are also the materials of choice for automotive engineering applications where flame retardancy is required.

Ultramid® A3X2G5, A3X2G7 and A3XZG5 are UL-listed for outdoor applications (f1). The Inclined Plane Tracking test (tracking and erosion) is passed at a test voltage of 1,000 V for more than 60 minutes (according to ASTM D-2303, time-to-track method). The chemical resistance and the stress cracking resistance are also excellent. These products are outstandingly well suited to use in photovoltaic applications.

Switchgear

Generator  
brush holder

Power electronics

# Ultramid® (PA)

For connection technology in solar installations, a suitable grade is Ultramid® A3XZG5 with its excellent impact resistance even at low temperatures. This means it can even pass the UL 1703 cold-impact test (steel ball drop test) at -35°C.

The high stiffness of Ultramid® A3X2G7 makes it particularly suitable for plug connectors in photovoltaic systems: very slim plugs can be designed which nevertheless comply with the stringent requirements.

Test results: 1 kV, time-to-track ≥ 60 min.:

Ultramid® A3XZG5	115 min.
Ultramid® A3X2G5	109 min.
Ultramid® A3X2G7	153 min.

Table 1: Values of selected Ultramid® types, Inclined Plane Tracking (IPT), ASTM 2303

The likewise high-impact modified Ultramid® A3XZC3 ESD has due to its reinforcement with carbon fibers a reduced electrical surface resistance. Therefore, this product is suitable for requirements for ESD protection (e. g. from the ATEX regulations).

Photovoltaic connectors

Photovoltaic connectors

Photovoltaic junction box

When using the injection molding grades Ultramid® A3UG5, A3U42G6, A3U44G6 DC, B3UG4, B3U30G6, B3U42G6, B3U50G6 and B3UGM210, are used, application-specific colors can be combined with the extensive property profile of reinforced thermoplastics with UL 746C compliance.

The light-colorable Ultramid® B3U50G6, with a GWIT of 800 °C (1 millimeter), reliably meets the requirement of GWIT 775 °C set by the household appliance standard IEC 60335-1 and is noted for its particularly high flowability. The product reinforced with 30 percent glass fibers is rated V-0 (according to UL94) for thicknesses starting at 0.75 millimeters, with an RTI value of 150 °C for electrical properties.

Charging inlet

CEE-Stecker

Terminal carrier

# Ultramid® (PA)

Ultramid® B3UGM210 is a light-colorable plastic with a mineral flame-retardant system showing extremely low smoke density (Fig. 1) and smoke toxicity in the event of a fire. It achieves UL 94 class V-0. Its thermal conductivity is very high for plastics: 1 W/(m K). This grade is particularly suitable for switchgear in buildings and industrial plants, in rail vehicles as well as for thermal management in electronics applications.

The Ultramid® B3UG4 and B3U30G6 grades achieve the classification V-2 according to UL 94. They were developed primarily for building installation applications, especially for miniature circuit breakers. Compared with the established Ultramid® B3UG4, the Ultramid® B3U30G6 a further significant increase in stiffness and improved flowability have been achieved. This opens up additional design options, e.g. in the field of miniaturization. The unreinforced Ultramid® C3U is characterized by excellent flowability and toughness. The product can be broadly colored and achieves the GWIT 775 °C rating in the glow wire test on the platelet. This unreinforced flame retardant grade is used wherever high toughness combined with exceptionally good fire performance is required. The main application is currently the production of terminal blocks for building installation and industrial control units.

The injection-molding grades Ultramid® A3K R01 and B3S R03 are free-flowing, quick to process and inherently flame-retardant. Ultramid® A3K R01 achieves UL 94 class V-2 from a wall thickness of 0.4 mm and is particularly suitable for industrial parts which are subject to high loading such as bearings and gear wheels as well as electrical insulating parts such as terminal blocks and cable connectors. Ultramid® B3S R03 is UL 94 V-2-listed from a wall thickness of 0.8 mm. It is used for CEE connectors, screwed cable glands, and thin-walled industrial components such as housings, fittings, grips, fixing clamps and other small parts.

Ultramid® A3U44G6 DC G6 (PA66) is part of the portfolio of engineering plastics for the e-mobility market. While conventional polyamides tend to yellow, Ultramid® exhibits color stable dyeability (at 140 °C for 1000 h) in orange (RAL 2003). It also meets other high technical requirements of the industry, such as high stiffness and toughness, outstanding mechanical resistance to high temperatures and good hydrolysis resistance. With the use of non-halogenated stabilizers, the product achieves UL 94 V-0 flame retardancy. The product is used primarily in connectors in the high-voltage range.

The partially aromatic products based on Ultramid® ONE (PA66/6T, melting temperature TM 280 °C), Ultramid® T (PA6T/6, melting temperature TM 295 °C), Ultramid® Advanced T2000 (PA6T/66, melting temperature TM 310 °C) and Ultramid® Advanced N (PA9T, TM 300 °C) are for instance suitable for modern soldering processes with lead-free solder at elevated temperatures, due to their high melting temperatures. In addition, the very low water absorption of Ultramid® Advanced-grades also has a positive effect here.

The brands Ultramid® A3U44G6 DC and Advanced N3U42G6 are specifically optimized for applications in e-mobility.

The injection molding grade Ultramid® B3U42G6 with outstanding flame retardant properties also meets all the requirements for smooth processing in the extrusion process. The homogeneous melt does not form nozzle deposits while maintaining high melt strength. The grade is also characterized by a high elongation at break and particularly high toughness, and is dyeable. Ultramid® B3U42G6 has a wide range of applications as a flame retardant material, e.g. in pipes, profiles, films and cable sheathing.

# Ultradur® (PBT)

Ultradur®, the polybutylene terephthalate (PBT) from BASF, has a specific combination of properties making it an ideal material for particular applications in electrical engineering and electronics. It shows not only high stiffness and good thermal resistance but also exceptional dimensional stability and excellent long-term electrical and thermal performance.

Flame-retardant PBT has hitherto almost always used halogenated flame retardant systems. Halogen-free solutions providing high efficiency have been rarely available to date because they are difficult to achieve. BASF can supplement the existing range of flame-retardant PBT with several Ultradur® grades with halogen-free flame-retardant and excellent property profiles.

Ultradur® B4441 G5 has a flame retardant system which is halogen-free and color-neutral. It achieves UL 94 class V-0 even at 0.4 mm and passes the GWIT 775 °C glow-wire test. This grade is therefore highly suitable for household appliances, plug connectors and automation applications. It can also be used for automotive electronics components like control devices and sensors, if these require flame retardant equipment.

Ultradur® B4450 G5 contains another innovative halogen-free flame retardant system. Specific features here are very high tracking resistance (CTI 600) and exceptionally good contact corrosion performance. The product is preferred for use in power electronics, where superior electrical properties are required even at very high temperatures. Compliance with UL 94 V-0 is achieved for thicknesses starting at 1.5 mm. The product is laser-markable (1,064 nm) if it is uncolored, light-colored or black.

The unreinforced Ultradur® B4440 achieves UL94 class V-0 for thicknesses starting at 0.4 mm. It is noted for its particularly high elongation at break (greater than 20 %) and its very high tracking resistance (CTI 600).

Preferred application sectors are electrical systems in rail vehicles, circuit breakers, plug connectors, and electronic switching elements for higher voltages (e.g. rail vehicles, alternative drives, and photovoltaic systems).

connectors

Safety switch housing

Steering angle sensor

## Ultradur® (PBT)

The well-established flame-retardant Ultradur® B4406 grades are available without reinforcement and also with 10 %, 20 % and 30 % glass fiber content. They feature good mechanical properties, high dimensional stability, and exceptional flame retardance: all colors and glass fiber contents achieve UL 94 V-0 from 0.4 mm wall thickness. If particularly high requirements are placed on mechanics and flowability, the very free-flowing Ultradur® B4406 G6 High Speed is used. Examples of application sectors for these PBT grades are plug connectors, coil formers, and other components of circuit breakers or low-voltage industrial switchgear.

The Ultradur® product family is ideally suited for the electro mobility market due to its particularly good electrical properties and it offers color stable dyeability in orange (RAL 2003). It also meets other high technical requirements from the industry, such as high stiffness and toughness, outstanding mechanical strength at high temperatures, and good hydrolysis resistance. Using non-halogenated stabilizers, the product achieves UL 94 V-0 flame retardancy. The product is used primarily in connectors in the high-voltage range.

The extrusion grade Ultradur® B4440 R01 with outstanding flame retardant properties meets all requirements for smooth processing. The homogeneous melt does not form nozzle deposits while maintaining high melt strength. The grade is also characterized by a high elongation at break and particularly high toughness and can be dyed. Being a flame retardant material, Ultradur® B4440 R01 has a wide range of applications, e.g. in pipes, profiles, films and cable sheathing.

Contact of polyesters with water, also in the form of air humidity, leads to hydrolytic cleavage of the polymer chains and hence to a weakening of the material, particularly at elevated temperatures. Important material properties such as strength, elasticity and toughness are affected when the material is subject to hydrolytic damage.

In application cases when moisture acts on the component at relatively high temperatures and over a particular period of time, additives are generally used as hydrolysis stabilizers. These additives counteract chain cleavage by hydrolysis, significantly delay hydrolytic degradation and can thus prolong the lifetime of a component considerably. The development of hydrolysis-stabilized Ultradur® grades provides materials which combine the proven good properties of Ultradur® with a much higher resistance to the effects of moisture. So it is even possible to manufacture applications for the highest stress classes. For the E&E industry, BASF offers the flame-retardant and hydrolysis-stabilized grade Ultradur® B4450 G5 HR.

Switchgear

# Ultrason® (PESU, PSU, PPSU)

BASF's Ultrason® grades are amorphous thermoplastics with high temperature resistance which are based on polyethersulfone (PESU), polysulfone (PSU), and polyphenylsulfone (PPSU). Particular features are their high dimensional stability and good mechanical properties that are substantially independent of temperature (Fig.3).

Ultrason® is inherently flame-retardant and in many formulations requires no additional flame retardant to achieve UL 94 V-0 starting at a thickness of 1.5 mm. This property profile together with good electrical insulation properties, high heat-aging resistance, and good hydrolysis resistance makes Ultrason® particularly suitable for highly stressed components over a wide temperature range from -50 to +180 °C.

Typical examples of applications for Ultrason® in electrical engineering and electronics are:

- coil formers, plug connectors, parts for circuit breakers and relays
- viewing windows for indicator lamps and switching boards, lamp sockets, lamp covers and reflectors
- heat shields, sensors, chip carriers, chip trays

Ratchets for circuit breakers

## Elastollan® (TPU)

The high-performance material Elastollan®, the thermoplastic polyurethane (TPU) from BASF, has a versatile property profile that makes it an ideal material for applications in signal transmission and energy transfer. Besides a high level of resistance to abrasion and mechanical wear, Elastollan® also has a wide range of strengths: The hydrolytic resistance and the outstanding low-temperature flexibility and resistance to microbes represent considerable advantages in particular for the polyether-based Elastollan® grades used in industrial applications. The polyester-based Elastollan® grades are noted above all for their resistance to oil and grease.

As a leading supplier of flame-retardant TPUs, BASF's Elastollan® FHF and HFFR ranges provide high-quality products which combine efficient,

halogen-free flame retardance with the outstanding mechanical properties that are typical of TPUs. Based on their flammability from HB up to V-0 (according to UL94), they are used in a wide variety of industrial applications. Typical areas of application are flame-retardant cable jacketing and connectors in automation engineering and also cables and film applications in the automotive, aviation, and construction industries.

Cables, connectors and grommets made of Elastollan®: Direct overmolding of cables, even when using different Elastollan® grades, produces a dense, highly durable compound structure comprising the cable jacket, contact carrier, and grommet. Every single one of these elements is also noted for its high resistance to wear and abrasion.

Cable

The polyether-based Elastollan® grades offer a persuasive choice thanks to their excellent cut resistance and high tear and tear propagation resistance over a wide temperature range. This ensures that no weak spots occur even in highly stressed cable sheaths and tubes. Grades that have proven to be particularly suitable for extruded cables, power lines and control cables are Elastollan® 1185 A10 FHF, 1185 A10 HFFR, 1190 A10 FHF and 1192 A11 FHF. Elastollan® 1192 A11 FHF has improved fire-retardant properties which allow it to be used as a cable jacketing for thin-walled UL-approved lines. Elastollan® 1185 A10 HFFR has particularly low smoke density and toxicity, as required in railway applications, for example.

Injection-molded connectors, strain relief sleeves and cable crossovers, which are used primarily in industrial applications, are manufactured predominantly from the unreinforced polyether grades Elastollan® 1185 A10 FHF, 1185 A10 HFFR, 1195 A 10/15. If higher levels of toughness are required, the polyether grade Elastollan® 1154 D10 FHF is a particularly good choice. Elastollan® 1175 A10 W has established itself in automotive manufacturing for strain relief sleeves for ABS and ESP cables.

Contact carriers and connectors, which need to have very good impact strength with high stiffness combined with good elongation, a low coefficient of thermal expansion and low shrinkage, can be fabricated particularly efficiently using the glass fiber-reinforced, polyester-based Elastollan® R3000. This Elastollan® grade also displays outstanding electrical properties with a tracking resistance of 600.

An easy flowing injection molding grade for fast processing. Used for highly stressed technical parts, such as bearings, gear wheels and electrically insulating parts such as terminals and cable connectors.

Halogen-free, flame retardant injection molding grade for e.g. terminal blocks and other electrical insulating parts with very thin walls.

Without halogens and phosphorous flame retardant injection molding grade, used e.g. for impact resistant electrical insulating parts such as contact bases and plug connector strips. Due to the halide free stabilization the impact on corrosion is minimized and sensitive electronic components are better protected.

An easy flowing, finely crystalline injection molding grade for very fast processing. Parts produced include thin-walled technical parts (e.g. housing, fittings, grips, small parts and fixing clamps).

Without halogens flame retardant glass fiber reinforced injection molding grade. The product is light colorable and provides good mechanical and electrical properties. Due to the halide free stabilization the impact on corrosion is minimized and sensitive electronic components are better protected.	Without halogens flame retardant glass fiber reinforced injection molding grade; light colorable; outstanding mechanical and electrical properties.	Without halogens flame retardant glass fiber reinforced injection molding grade for plastic parts in electrical applications. The product provides good mechanical and electrical properties. Due to the halide free stabilization the impact on corrosion is minimized and sensitive electronic components are better protected.	Without halogens flame retardant glass fiber reinforced injection molding grade for plastic parts in electrical applications like connectors. The product is light colorable and provides enhanced color durability at elevated temperatures as well as good mechanical and electrical properties. ue to the halide free stabilization the impact on corrosion is minimized and sensitive electronic components are better protected.	Glass fibre reinforced injection molding grade with improved flame retardance based on red phosphorus, giving outstanding mechanical and electrical properties for components requiring high stiffness.	An impact-modified, glass fibre reinforced injection molding grade with improved flame retardance based on red phosphorus; for components requiring high stiffness and enhanced toughness, (e.g. PV-connectors an PV-junction boxes).

An impact-modified, glass fibre reinforced injection molding grade with improved flame retardance based on red phosphorus; for components requiring high stiffness and enhanced toughness, (e. g. PV-connectors an PV-junction boxes).

Glass fibre reinforced injection molding grade with improved flame retardance, Flame retardant based on red phosphorus; giving outstanding electrical properties and very high stiffness and strength.

Glass fibre reinforced injection molding grade with improved flame retardance, Flame retardant based on red phosphorus; giving outstanding electrical properties and very high stiffness and strength.

An impact-modified, carbon fibre reinforced injection molding grade with reduced surface resistivity, Flame retardance based on red phosphorus for components requiring enhanced toughness and special requirements on electrical properties.

Halogen free flame retardant injection molding grade with outstanding free-flow properties, good electrical properties and low smoke density; resistant to glow wire test to 960°C.

Without halogens and phosphorous flame retardant glass fiber reinforced injection molding grade with outstanding flowability properties, good electrical properties and low smoke density. The product is resistant to the glow wire test GWFI up to 960°C. Due to the halide free stabilization the impact on corrosion is minimized and sensitive electronic components are better protected.

Without halogens flame retardant glass fiber reinforced injection molding grade for plastic parts in electrical applications. The product provides good mechanical and electrical properties. Due to the halide free stabilization the impact on corrosion is minimized and sensitive electronic components are better protected. In particular optimized for the glow wire requirements of IEC 60335.

Without halogens and phosphorous flame retardant glass fiber reinforced injection molding grade with very high rigidity for plastic parts in electrical applications. The product is light colorable and provides good mechanical and electrical properties as well as a low smoke density. Due to the halide free stabilization the impact on corrosion is minimized and sensitive electronic components are better protected.

Halogen- and phosphorus-free flame retardant grade with medium stiffness and low smoke density. Passes glow wire test up to 950 °C.

Partially aromatic polyphthalamide for injection molding and extrusion with strong mechanical properties especially at elevated temperatures and excellent chemical resistance for highly stressed parts, electrical insulating parts and cable ducts. The flame retardant is without halogens and can be characterized as polymer with extremely low water absorption and outstanding dimensional stability. It features a high melting point (300 °C) and excellent melt stability.

Partially aromatic polyamide, halogen-free flame-retardant, with good mechanical and dielectric properties in presence of humidity and at elevated temperatures. It is easily colorable and allows easy processing with low tool corrosion.

Partially aromatic polyamide, halogen-free flame-retardant, with good mechanical and dielectric properties in presence of humidity and at elevated temperatures. It is easily colorable and allows easy processing with low tool corrosion.

A glass fibre reinforced, flame retardant, partially aromatic polyamide for injection molding. Good mechanical properties, low water absorption, high melting point (295 °C). High tracking resistance, low tendency to form deposits on electrical contacts, very resistant to electrolytic corrosion, resistant to soldering temperatures, can be electroplated.

Partially aromatic polyamide, halogen-free flame-retardant, light colorable, outstanding flame retardance, resistant to soldering temperatures.

Polyphthalamide, light colorable, with a high melting point, halogen-free flame-retardant, very low water absorption, good mechanical and dielectrical properties at elevated temperatures as well as excellent chemical resistance, soldering bath resistant, Colors available (e. g. Orange RAL 2003).

Polyphthalamide, light colorable, with a high melting point, halogen-free flame-retardant, very low water absorption, good mechanical and dielectrical properties at elevated temperatures as well as excellent chemical resistance, soldering bath resistant.

Polyphthalamide, light colorable, with a high melting point, halogen-free flame-retardant, low water absorption, good mechanical and dielectrical properties at elevated temperatures, soldering bath resistant, Colors available (e. g. Orange RAL 2003).

Polyphtalamide, with a high melting point, halogen-free flame-retardant, low water absorption, good mechanical and dielectrical properties at elevated temperatures, soldering bath resistant.	Partially aromatic, glass fiber reinforced and flame retardant polyphthalamide for injection molding with outstanding electrical and mechanical properties, good long-term thermal stability and chemical resistance for highly stressed parts. The flame retardant is without halogens and highly stable against migration and weathering.	Polyphtalamide, with a high melting point, halogen-free flame-retardant, low water absorption, good mechanical and dielectrical properties at elevated temperatures, soldering bath resistant.	Polyphtalamide, with a high melting point, halogen-free flame-retardant, low water absorption, good mechanical and dielectrical properties at elevated temperatures, soldering bath resistant.

Impact modified grade for extrusion and injection molding; flame retardant halogen and antimony free; light colorable; for parts requiring enhanced fire resistance and toughness (e. g. connectors and loose tubes).

Injection molding grade with 25 % glass fibres, for parts requiring enhanced fire resistance (e. g. components for household appliances, connectors, power switches), halogen and antimony free.

Injection molding grade with 25 % glass fibers for parts requiring enhanced fire resistance as well as increased tracking resistance (e. g. lamp sockets, connectors, power switches, coil formers, housings for control units), halogen and antimony free.

Injection molding grade with 25 % glass fibers, halogen- and antimony-free for parts requiring enhanced fire resistance, specially optimized for good hydrolytic stability and increased tracking resistance.

**PACIFIC** – The **automated platform solution** streamlines the provision and receipt of **Product Carbon Footprint (PCF) data across the entire value chain**, significantly **reducing manual work**. It translates the benefits of BASF's SCOTT PCF calculation tool to the n-Tier chain, ensuring **trustworthy and immutable data exchange** for seamless sharing with partners. Additionally, this solution can be integrated with other systems within the **Catena-X ecosystem**.
